

GFM preprocessing throughput: SurtGIS vs Python reference

Wall-clock time to extract 200 labelled patches of size HxH from a 1024x1024 grid with 6 HLS-equivalent bands, repeated 3 times. SurtGIS additionally processes 3 timestamps per chip (output [N,C,T,H,W]); the Python reference handles one timestamp. Mean speedup at tile 224: 1.54x.
